

NULLA is a complete rollaway lamp.

A 10mm hole, a special optical system and led technology create a wonder light on a plane. NULLA can be installed only on false ceiling with a thickness of 12,5mm or 15mm

The distance required between the false ceiling and the base of the roof should be at least 75mm.

NULLA works with a 500mA current so the transformer can be installed remote (maximum distance 10 mt).

NULLA can be installed with 3 different solutions:

Absolute installation:

NULLA has to be installed during false ceiling realization.

In case of maintenance for the lamp, it is necessary to break the false ceiling and restore it again

Installation on a complete rollaway access panel

Nulla has to be installed on an access panel 200x200 mm available on price list

In case of maintenance for the lamp it is possible to open the panel.

Installation close to a complete rollaway access panel

Nulla has to be installed close to an access panel 400x400 mm available on price list and located with a distance which can allow the access to the lamp..

Concerning the distance between false ceiling and the base of the roof, it has to be wide enough to act comfortably.
